Features

Project: Biconoir's Restaurant

Team: ByteClub

Feature 1: Customer UI & Digital Menu Experience

Description: This feature encompasses the frontend user interface, brand identity integration, and the core browsing and cart management experience for the customer.

- **Task 1.1:** Set up the base web application template, applying a global Spanish language localization (es-ES) across all text assets and navigation menus.
- **Task 1.2:** Implement the new brand identity: integrate the green logo, apply a cohesive green color palette/theme to the interface, and update the main landing page title to "Biconoir Restaurant" (ensuring high-contrast readability).
- **Task 1.3:** Develop the dynamic menu layout using a card-based UI component. Each card must display the item's name, product image, price, and text description.
- **Task 1.4:** Build the ingredient customization feature allowing users to deselect specific base ingredients (e.g., remove cheese/onions) within the menu card before adding the item to their order.
- **Task 1.5:** Implement the shopping cart interface and background state logic to allow customers to add items, remove items, modify quantities, and calculate the running subtotal.

Feature 2: Table Reservation Management

Description: This feature handles the scheduling system, allowing customers to book tables and giving administrators the tools to manage the dining room capacity.

- **Task 2.1:** Create the customer-facing frontend reservation form to capture the requested Date, Time, and Number of Guests.
- **Task 2.2:** Implement backend API endpoints to validate table availability, preventing double-booking or overcapacity for the requested time slots.

- **Task 2.3:** Build the Administrator UI dashboard component to query and display a list of all active and scheduled reservations for the current day.

Feature 3: Operational Backend & Workflow Fulfillment

Description: This feature covers the internal mechanics required to track raw materials, manage the kitchen's active workflow, and secure system records.

- **Task 3.1:** Write the backend script for real-time ingredient inventory deduction, ensuring stock quantities decrease automatically upon order confirmation.
- **Task 3.2:** Develop an interactive Order Status view for the kitchen staff, allowing them to manually update the progress of active tickets (e.g., Pending, Preparing, Ready).
